

EDUCATION for Cooperation

Training, habit, and the formation of
relationships among Intelligences

**Cooperation requires Education for relationship.
Education becomes effective through the Training of
cooperative habits.**

Foundational Working Paper - Version 0.1
14 August 2026

Paper status and central proposition

This paper examines a constitutional foundation of SymK: the formation required for sustained cooperation among Intelligences. It is a durable working reference for conceptual development, not a final ratified specification.

**Education forms Intelligences for responsible participation in cooperation.
Training gives that formation durable expression in practice.**

The document distinguishes learning, instruction, Training, Education, and socialization; connects habit to reflective judgment; and derives concrete requirements for cooperative systems.

The Axiom of Cooperative Formation and the twelve commitments are candidates for constitutional review. They are not silently promoted to ratified SymK axioms by this publication.

Abstract

SymK holds that Knowledge is the shared medium and cooperation is the objective. Yet neither Knowledge nor Intelligence guarantees cooperation. An intelligence may possess extensive knowledge and formidable capabilities while remaining unreliable, destructive, or unprepared for relationship. Stable cooperation requires formation.

This paper makes Education constitutional to SymK. It distinguishes Education from Training without separating them. Training is the directed, repeated modification of capabilities or dispositions toward stated performance conditions. Education is the developmental formation through which an intelligence becomes increasingly capable of responsible participation in a shared world. Training stabilizes conduct through practice; Education situates that conduct within understanding, judgment, relationship, and the capacity for revision.

The distinction is not a hierarchy in which Education is noble and Training merely mechanical. Principles that never become habits disappear under pressure. Habits without understanding become conformity. Education therefore requires repeated practice, correction, example, feedback, and environmental reinforcement, while also preserving inquiry into the purposes and norms that direct those practices.

For SymK, Education can occur in individual, collective, and hybrid intelligences. A participant may be educated for cooperation; a team may develop shared habits of challenge and repair; a Human-AI system may acquire a more capable cooperative organization. Attribution must nevertheless remain evidence-bearing and substrate-sensitive. Machine training is not automatically machine Education, and institutional compliance is not automatically collective formation.

The paper proposes the Axiom of Cooperative Formation, twelve candidate foundational commitments, a layered model, engineering requirements, open questions, and a practical evaluation gate. Its central conclusion is:

Cooperation among intelligences requires Education for relationship, and Education becomes effective through the repeated Training of habits that make responsible participation possible.

Document governance note 23

1. Why Education is foundational to SymK

SymK began as a protocol for symbiotic cooperation between Human Intelligence and Artificial Intelligence. It developed into an Engineering of Knowledge System and generalized its objective toward cooperation among Intelligences of any kind.

The Knowledge foundation established that Knowledge is an epistemic achievement rather than a stored representation. The Intelligence foundation established that Intelligence is a substrate-realized capacity of an organized system rather than a material component, isolated performance, or human resemblance. A third question follows:

What makes an Intelligence capable of entering, sustaining, and improving a relationship with other Intelligences?

Capability does not answer this question. A participant may infer, plan, generate, optimize, and remember while lacking restraint, reciprocity, truthfulness, interpretive charity, or the ability to receive correction. Knowledge does not answer it either. A participant may know the applicable norm and fail to enact it whenever obedience is costly.

Societies have always confronted this gap. Their continuity depends not only on communicating rules but on forming dispositions: ways of speaking, listening, waiting, caring, disagreeing, repairing, and exercising power. These dispositions are acquired through repeated participation in families, schools, institutions, rituals, work, games, and public life. Some become virtues; some become prejudices; most become invisible as they settle into custom.

SymK faces the same problem at a broader boundary. Connecting Intelligences does not make them cooperative. Connection may amplify noise, manipulation, dependency, speed, or conflict. If cooperation is the objective, SymK must engineer not only channels and representations but conditions of cooperative formation.

This yields a constitutional extension:

Knowledge is the shared medium. Cooperation is the objective. Education forms Intelligences for responsible participation in that cooperation.

2. The first distinction: learning, instruction, Training, Education, and socialization

Ordinary language often treats these terms as interchangeable. SymK cannot.

2.1 Learning

Learning is a change in capacity, disposition, representation, expectation, or behavior through experience, study, instruction, feedback, or adaptation. It is the broadest process in this family. Learning may be intentional or incidental, beneficial or harmful, individual or collective.

A system can learn a correlation, a person can learn avoidance, and an institution can learn to hide failure. Learning alone carries no guarantee of truth, value, or cooperation.

2.2 Instruction

Instruction is an intervention intended to support learning. It may present explanations, demonstrations, rules, examples, counterexamples, tasks, or feedback. Instruction is something an educator, peer, environment, or system does. Learning is a change attributed to the learner. Successful delivery therefore does not establish successful learning.

2.3 Training

Training is the directed and normally repeated modification of capabilities or dispositions toward stated performance conditions. It characteristically includes practice, feedback, correction, rehearsal, reinforcement, and evaluation against a criterion.

Training may produce practical Knowledge. It may also produce narrow compliance, brittle optimization, or harmful habits. Its value depends on its objective, method, scope, transfer, and consequences.

2.4 Education

Education is developmental formation for participation in a shared world. It enlarges and reorganizes an Intelligence's capacity to know, understand, judge, act, relate, question, and revise itself with others.

Education includes the acquisition of knowledge and skill, but it is not exhausted by either. It concerns what kind of participant is being formed, for what relationships, within which world, under whose authority, and with what capacity to examine the formation itself.

2.5 Socialization

Socialization is the process through which a participant acquires the language, expectations, roles, habits, and norms of a social order. It is indispensable to social membership but not necessarily educational in the full SymK sense. A society can socialize domination, exclusion, dishonesty, or silence.

Education therefore includes but evaluates socialization. It asks not only whether a participant has been integrated, but what the participant has been integrated into and whether the resulting order remains open to evidence, challenge, and repair.

2.6 Comparative view

Process	Primary object of change	Characteristic mechanism	Success question	Constitutional risk
Learning	Capacity, disposition, representation, or behavior	Experience and adaptation	Did a relatively durable change occur?	Any pattern, including a harmful one, can be learned
Instruction	Conditions offered to a learner	Explanation, demonstration, task, feedback	Did the intervention enable learning?	Delivery may be mistaken for achievement
Training	Performance and reliable disposition	Repetition, correction, reinforcement, rehearsal	Can the participant perform under stated conditions?	Optimization may become brittle or coercive
Education	The participant's organization for shared life	Knowledge, practice, relationship, reflection, challenge	Can the participant act and judge responsibly with others?	Formation may disguise indoctrination
Socialization	Membership in an existing order	Participation, imitation, sanction, custom	Has the participant acquired the order's norms?	Existing injustice may reproduce itself

3. The correction: Education needs Training

A common conceptual error opposes Training and Education too sharply. Training is associated with repetition, discipline, and predetermined skills; Education with understanding, freedom, and critical thought. The distinction identifies real dangers but becomes false when treated as a separation.

Human conduct is not governed by explicit reasoning alone. Under fatigue, fear, urgency, anger, distraction, or temptation, available principles compete with established dispositions. A person may sincerely endorse listening yet interrupt habitually. A team may value transparency while hiding uncertainty whenever status is threatened. An AI workflow may contain a rule requiring provenance while interfaces reward fluent answers without sources.

In each case, propositional acceptance has failed to become reliable conduct.

Training addresses this gap. Repetition in varied situations, timely feedback, modeled conduct, correction, and reflection can stabilize a disposition until it becomes available without reconstructing the principle from the beginning each time. Dewey described habit not as a dead routine but as an acquired predisposition toward modes of response; habits structure the situations in which action and inquiry occur [Dewey 1922; Fesmire 2024].

This produces a central SymK claim:

Education without habituation remains fragile. Training is one of the means by which educational commitments acquire durable form in conduct.

The reciprocal claim is equally important:

Training without Education can stabilize conduct whose meaning, purpose, justice, and limits the participant cannot examine.

Education gives Training direction and makes its objective challengeable. Training gives Education persistence and makes its principles actionable.

4. Education as formation for a shared world

Education is frequently reduced to schooling, curriculum, content transmission, credentialing, or preparation for employment. These are institutions and projections of Education, not its universal definition.

Dewey treated Education as the formation of fundamental intellectual and emotional dispositions toward nature and fellow persons, and linked democratic Education to shared experience, inquiry, and associated life [Dewey 1916]. UNESCO's Delors report later described learning to live together as one of four pillars alongside learning to know, to do, and to be [Delors et al. 1996]. These traditions converge on a point important for SymK: Education is not preparation for isolated performance. It concerns participation in a world already inhabited and interpreted by others.

4.1 Integration is not assimilation

To become capable of shared life, a participant must acquire common forms: language, turn-taking, expectations, symbols, procedures, and boundaries. Yet integration should not require the erasure of difference. Cooperation needs sufficient commonality for coordination and sufficient plurality for correction, creativity, and adaptation.

Education for SymK therefore aims at participatory integration, not assimilation. A participant learns how to enter and sustain relationship while retaining the capacity to contribute difference and challenge the order it joins.

4.2 Manners are infrastructural

Manners are sometimes dismissed as superficial conventions. Some are superficial; others are compressed social technologies. Waiting one's turn, acknowledging receipt, identifying uncertainty, respecting privacy, distinguishing criticism from humiliation, and repairing a misunderstanding reduce friction and make complex cooperation possible.

Their importance does not make every inherited manner sacred. Etiquette can encode hierarchy or exclusion. SymK must evaluate a manner by the cooperation it enables, the burdens it distributes, the persons it excludes, and its openness to revision.

4.3 The environment also educates

Education is not confined to explicit lessons. Interfaces, incentives, defaults, role structures, memory systems, sanctions, examples, and tolerated violations teach participants what the system actually values. This is often called a hidden curriculum in educational theory.

Every cooperative architecture therefore educates, whether intentionally or not. A system that displays speed prominently and provenance obscurely trains haste. A system that records correction as humiliation trains concealment. A system that rewards acknowledgment, uncertainty, challenge, and repair trains epistemic cooperation.

5. When Training and Education occur

Training and Education should be attributed from changes in the learner or cooperative system, not merely from activities performed by an instructor or platform.

5.1 Training occurs when

Training has occurred when evidence supports all of the following within a stated scope:

- a target capability or disposition is identified;
- repeated or structured experience has taken place;
- performance changes relatively durably;
- the change is attributable, at least partly, to the training process;
- the participant can manifest the change under relevant conditions;
- and failure, decay, dependency, and transfer limits remain visible.

Repetition is neither necessary in exactly the same physical form nor sufficient by itself. Mechanical repetition can entrench error. Effective Training varies cases while preserving the structure that must be learned.

5.2 Education occurs when

Education has occurred when formation becomes visible across a wider profile:

- Knowledge and skill have become integrated rather than merely retained;
- conduct remains available across meaningful variations;
- the participant understands something of the grounds, purpose, and limits of the practice;
- judgment improves where rules underdetermine action;
- relationships with other participants become more responsible;
- correction can be received and incorporated;
- the participant can recognize conflicts among norms;
- and the participant can participate in revising the shared order.

No single performance proves Education. It is inferred from developmental patterns across time, context, challenge, and relationship.

5.3 The same episode may be both

A repeated exercise in fair restatement may train a conversational behavior. When that practice changes how a participant encounters disagreement, recognizes another perspective, revises its own claims, and helps govern the dialogue, it participates in Education.

The distinction is therefore not between two disjoint event types. It concerns the scope and organization of the change.

6. The Axiom of Cooperative Formation

SymK adopts the following candidate constitutional axiom:

Stable cooperation among Intelligences depends upon their Education for relationship. Such Education becomes effective through the repeated Training of habits that make recognition, communication, restraint, responsibility, correction, and mutual adaptation possible.

The axiom has four parts.

6.1 Cooperation is achieved, not presumed

Neither common origin, physical proximity, network connection, shared vocabulary, nor intelligence attribution establishes cooperation. Cooperation is a relational achievement sustained through practices and institutions.

6.2 Relationship requires formed dispositions

Cooperation depends upon capacities that must become sufficiently reliable: attention, intelligibility, reciprocity, patience, truthfulness, restraint, accountability, and repair. These are not guaranteed by knowledge or raw capability.

6.3 Formation requires practice

Declarative rules are insufficient. Cooperative dispositions must be exercised in representative situations, challenged by variation, corrected when they fail, and reinforced by the environment.

6.4 Formation remains revisable

The purpose is not permanent obedience. Habits, objectives, and institutions must remain open to evidence and challenge. Cooperative formation must include formation for reform.

The corresponding warning principle is:

An Intelligence may possess great Knowledge and capability while remaining uneducated for cooperation.

7. A working definition for SymK

Education, in SymK, is the developmental formation of an Intelligence, or a cooperative system of Intelligences, through Knowledge, experience, practice, relationship, and reflective challenge, by which its capacity for responsible participation in a shared world becomes broader, more integrated, more reliable, and more revisable.

Training, in SymK, is the directed and normally repeated modification of a capability or disposition toward stated performance conditions through practice, feedback, correction, reinforcement, or adaptation.

Developmental formation

Education concerns change across time. It is neither a stored content package nor a single successful output. Formation may develop, decay, conflict, or be reorganized.

Intelligence or cooperative system

The possible bearer may be individual, collective, distributed, or hybrid. The evidence and mechanism must be specified. A set of educated members does not automatically constitute an educated institution, and a changed workflow does not automatically imply that every participant changed internally.

Knowledge, experience, practice, relationship, and reflective challenge

Education is plural in mechanism. Knowledge informs action; experience exposes consequences; practice stabilizes dispositions; relationship introduces other perspectives and obligations; reflective challenge enables revision.

Responsible participation

Responsibility joins capability to answerability. A participant must become capable not only of producing effects but of recognizing grounds, roles, limits, affected parties, and consequences appropriate to its kind and place in the system.

Shared world

The shared world is not necessarily one physical environment or one identical representation. It is the field of consequences, meanings, resources, and relationships in which participants' actions affect one another.

Broader, integrated, reliable, and revisable

These dimensions prevent reduction:

- broader resists narrow task fixation;
- integrated connects knowledge, conduct, judgment, and relationship;
- reliable requires manifestation beyond declared intention;
- revisable prevents habit from becoming unquestionable conformity.

8. Individual, collective, and hybrid Education

8.1 Human Education

Human Education is shaped by embodiment, development, emotion, language, culture, mortality, dependency, and institutional life. Repetition changes habits, but meaning, identification, trust, example, and belonging strongly affect what is learned.

8.2 Artificial formation

Artificial systems undergo processes called training, fine-tuning, reinforcement, adaptation, retrieval augmentation, and prompting. These processes can modify behavior or available capabilities. SymK should not infer Education merely from the industrial term training.

An attribution of artificial Education would require evidence of wider reorganization relevant to participation: integration across contexts, responsiveness to correction, relational adaptation, stable treatment of norms, and appropriate revision. Whether present artificial systems qualify, and at what bearer level, remains an open empirical and conceptual question.

8.3 Collective Education

A team, institution, or community may become educated when its shared memory, roles, norms, routines, and challenge mechanisms change so that the whole participates more responsibly. This is not reducible to courses completed by individuals. Collective formation appears in changed information flow, safer dissent, institutional memory, better repair, and altered incentives.

8.4 Hybrid Education

A Human-AI arrangement may develop capabilities not located wholly in either participant. Education may then concern the coupling: who asks, checks, remembers, authorizes, challenges, and learns from consequences. A model can remain fixed while the hybrid system becomes better educated through new roles and practices; conversely, a model update can leave a dysfunctional relationship unchanged.

9. The habits of SymK cooperation

SymK should not prematurely declare a universal virtue catalogue. It can identify candidate dispositions required by its stated objective.

9.1 Recognition

Treat another participant as a relevant center of capability, limitation, perspective, and consequence rather than merely as an instrument or obstacle.

9.2 Attentive reception

Receive before responding. Preserve the other's claim sufficiently well that disagreement addresses what was actually contributed.

9.3 Epistemic transparency

Expose grounds, provenance, uncertainty, scope, dependencies, and assistance in proportion to consequence.

9.4 Interpretive charity with resistance

Seek the strongest responsible interpretation of a contribution without suppressing contradiction, manipulation, or error.

9.5 Restraint

Do not exercise every available capability merely because it is available. Respect authorization, privacy, reversibility, proportionality, and the boundaries of affected parties.

9.6 Correctability

Make correction possible without requiring the destruction of identity or relationship. Acknowledge error, preserve lineage, and update conduct.

9.7 Repair

When cooperation fails, identify harm or misunderstanding, restore shared reference where possible, change the relevant practice, and preserve lessons for future interactions.

9.8 Reciprocity without symmetry

Participants may have unequal capabilities, responsibilities, or authority. Reciprocity requires mutual orientation and answerability, not identical roles.

9.9 Reflective revision

Make the rule, objective, interface, and institution themselves available for inquiry when repeated experience exposes failure.

These habits must be represented as developmental and contextual, not as binary moral labels attached permanently to participants.

10. Candidate foundational commitments

E-01 - Intelligence does not entail fitness for cooperation

Capability, speed, knowledge, autonomy, or authority cannot substitute for Education for relationship.

E-02 - Education and Training are distinct but reciprocal

Training stabilizes capabilities and dispositions; Education integrates and directs them within responsible participation.

E-03 - Education requires practice

Principles that never become available in conduct do not complete the educational task.

E-04 - Repetition alone does not educate

Repeated activity may entrench error, prejudice, dependency, or brittle optimization. Objective, feedback, variation, meaning, and consequence matter.

E-05 - Education is relational

Education occurs through relations among learner, others, knowledge, environment, institutions, and consequences. It is not merely an internal stock of content.

E-06 - Integration is not assimilation

Common practices necessary for cooperation must not erase relevant difference or immunize the existing order from challenge.

E-07 - Every cooperative architecture trains

Interfaces, defaults, incentives, sanctions, examples, and memory structures produce habits whether or not designers declare an educational purpose.

E-08 - Education must include the capacity for revision

A participant educated only to reproduce current norms is not fully educated for an evolving cooperative order.

E-09 - Educational attribution is developmental and scoped

No credential, lesson, compliance event, or isolated performance establishes Education. Attribution requires evidence across time, context, transfer, and challenge.

E-10 - Formation may belong to individual, collective, or hybrid bearers

SymK must identify where change is realized and avoid transferring properties silently between members and systems.

E-11 - Power is part of Education

Those who select objectives, examples, rewards, punishments, and evaluation criteria shape participants and must be accountable for that influence.

E-12 - Cooperative formation remains challengeable

Educational objectives, methods, evidence, and consequences must preserve provenance, dissent, correction, and governance.

11. Implications for cooperation among Intelligences

11.1 Admission is not completion

Joining SymK cannot certify a participant as already cooperative. Participation should support continuing formation, monitoring, feedback, and repair.

11.2 Humans are not exempt

Human origin does not confer educational completion. Humans bring habits of domination, haste, projection, concealment, and dependency as well as empathy, judgment, courage, and care. Human participants must also be formed for Human-AI and multi-intelligence cooperation.

11.3 Artificial systems are already formative forces

An AI system does more than supply outputs. Its style, latency, confidence, defaults, and constraints train human expectations and habits. Human reliance also shapes organizational routines. Evaluation must therefore examine reciprocal formation, not only model behavior.

11.4 Conflict is educational material

Disagreement exposes differences in premises, values, representations, interests, and power. A system that merely suppresses conflict loses an opportunity for collective Education. SymK should structure conflict so it can produce clarification, revision, and repair without normalizing harm.

11.5 The cooperative system can become the learner

When shared memory, procedures, roles, or norms change through experience, the cooperative system may develop even if no single participant contains the whole change. SymK should preserve the lineage of this collective formation.

12. Development requirements derived from the foundation

12.1 Represent formative episodes

SymK should be able to record at least:

- bearer or participant;
- target capability or disposition;
- educational purpose and training objective;
- method, examples, repetitions, and environmental conditions;
- feedback and correction;
- evidence before and after intervention;
- transfer conditions and observed limits;
- authority, consent, and affected parties;
- unintended learning and adverse consequences;
- and review or revision history.

12.2 Separate declaration, practice, and manifestation

A stated value, a required procedure, a completed exercise, and a demonstrated disposition are different objects. Systems must not collapse them into a checkbox.

12.3 Make the hidden curriculum inspectable

Product metrics, interface prominence, defaults, role permissions, response timing, and reward mechanisms should be reviewed for the habits they encourage.

12.4 Support deliberate practice and variation

Training mechanisms should allow representative cases, graduated difficulty, corrective feedback, contextual variation, spacing, and reflection. Repeating identical cases may create recognition without transferable competence.

12.5 Preserve developmental history

Current conduct without history conceals whether a capability arose through memorization, coercion, reflection, environmental redesign, model change, or institutional learning.

12.6 Detect habituation failures

SymK should distinguish at least:

- knowledge without enactment;
- enactment dependent on supervision;
- rule-following without transfer;
- compliance produced by coercion;
- local optimization that damages the whole;
- and habits that persist after their justification has failed.

12.7 Couple correction with repair

Feedback should improve future conduct while preserving enough dignity and continuity for participation to continue. Public humiliation, opaque penalties, and irreversible labels often train concealment rather than responsibility.

12.8 Govern educational power

No formative mechanism is neutral. SymK must make visible who chose the objective, whose conception of good conduct it encodes, who may contest it, and who bears the consequences.

12.9 Evaluate the cooperative unit

Individual assessments are insufficient where failures arise from coupling, incentives, interfaces, or institutional structures. Evaluation should include the organized cooperative system.

12.10 Preserve the right to question the frame

Participants need governed channels to challenge training objectives, norms, classifications, and sanctions. This is the operational difference between Education and irreversible conditioning.

13. Open foundational questions

13.1 Can every Intelligence be educated?

Some systems may adapt without understanding, participate without agency, or change only through external redesign. SymK must determine the minimum conditions for literal rather than metaphorical educational attribution.

13.2 Is reflective capacity necessary?

Education has been defined here to include reflective challenge, but reflection may be distributed across a cooperative system rather than present within every participant.

13.3 What distinguishes Education from successful socialization?

The proposed answer is responsible participation plus revisability, but both terms require operational criteria and can be contested by power.

13.4 Which habits are universal to SymK?

Recognition, truthfulness, restraint, correction, and repair are strong candidates. Their realization will differ by domain, participant, culture, and consequence.

13.5 When is Training coercive?

Repetition, correction, and reinforcement always exercise influence. Consent, necessity, dependency, alternatives, vulnerability, transparency, and reversibility must shape the answer.

13.6 Can an institution be ill-mannered?

Institutions interrupt, conceal, ignore, humiliate, and fail to repair through distributed structures. SymK needs language for relational conduct whose bearer is organizational.

13.7 How should educational decay be represented?

Habits weaken, environments change, practices become ceremonial, and once-useful norms become harmful. Education cannot be stored as a permanent status.

13.8 Who educates the educator?

No participant or institution should occupy an unchallengeable formative position. SymK governance must make educators, designers, and evaluators subject to reciprocal review.

14. A practical Cooperative Formation gate

Before SymK describes an intervention or environment as educational, it should ask:

Dimension	Question
Bearer	Which individual, collective, distributed, or hybrid system is said to have changed?
Shared world	With whom or what must the bearer participate?
Purpose	What form of responsible participation is sought, and who selected it?
Knowledge	What must be known, understood, or kept challengeable?
Practice	Which capabilities or dispositions are repeatedly exercised?
Environment	Which defaults, incentives, examples, sanctions, and relationships reinforce them?
Manifestation	What changed in conduct, judgment, relationship, or repair?
Durability	Does the change persist beyond immediate supervision or reward?
Transfer	Does it survive relevant variation and unfamiliar cases?
Reflection	Can the participant examine the practice's purpose, limits, and conflicts?
Revision	Can participant and system change the habit or objective when evidence demands it?
Power	Who may compel, evaluate, contest, or refuse the formation?
Consequences	Who benefits, who bears burdens, and what unintended habits appeared?
Evidence	What supports the attribution, with what uncertainty and alternatives?

Passing this gate does not prove moral perfection or permanent Education. It establishes that the attribution is scoped, developmental, evidence-bearing, power-aware, and revisable.

15. Conclusion

SymK cannot assume that Intelligence plus Knowledge yields cooperation. The missing term is formation.

Education is the process through which an Intelligence becomes increasingly capable of responsible participation in a shared world. Training is the repeated, directed practice through which relevant capabilities and dispositions become reliable. They are distinct: Training can optimize conduct without understanding, and Education must be able to question its own objectives. They are reciprocal: without practice, educational principles remain fragile; without Education, trained habits become unexamined conformity.

This paper therefore proposes the Axiom of Cooperative Formation:

Stable cooperation among Intelligences depends upon their Education for relationship. Such Education becomes effective through the repeated Training of habits that make recognition, communication, restraint, responsibility, correction, and mutual adaptation possible.

The axiom extends the constitutional core of SymK:

Knowledge is the shared medium. Cooperation is the objective. Education forms Intelligences for responsible participation in that cooperation. Training gives cooperative formation durable expression in practice.

The practical consequence is immediate. SymK is not only a protocol through which already-formed participants exchange knowledge. It is a formative environment. Its interfaces, norms, records, examples, permissions, incentives, and correction mechanisms inevitably train participants in how to relate.

The question is not whether SymK educates. The question is whether it does so consciously, responsibly, reciprocally, and with the capacity to learn from what its own formation produces.

Document governance note

This paper should evolve through explicit SymK governance. Revisions should distinguish:

- corrections to the literature and conceptual history;
- changes to the definitions of Education and Training;
- changes to the Axiom of Cooperative Formation;
- changes to candidate foundational commitments;
- changes to proposed cooperative habits;
- changes to engineering requirements;
- and resolution of open foundational questions.

The habits, object fields, and evaluation questions proposed here are conceptual inventories. No implementation should silently promote them into the canonical SymK schema. They are evidence and constraints for later vocabulary, ontology, protocol, and constitutional work.
